Estimados Señores

Ref: CDI APARTADO
Apartado

La presente tiene por objeto confirmar que los diseños para el proyecto de la referencia , al que corresponden estas memorias de cálculo, fueron realizadas de acuerdo con La NORMA COLOMBIANA DE DISEÑO Y CONSTRUCCIÓN SISMO RESISTENTE (NSR 10), Y DECRETOS REGLAMENTARIOS, las consideraciones de cimentación y de caracterización están de acuerdo con el estudio de suelos realizado en el sitio, declaramos que asumimos la responsabilidad por dichos diseños aquí consignados, y de acuerdo con lo anterior la revisión hecha por la Oficina de Planeacion Municipal , NO constituye una aprobación del diseño estructural , por parte suya , o por parte de la administración Municipal, sino una verificación del cumplimiento de las normas antes mencionadas.

Cordialmente

Camilo Esteban Benavides
Mat 25202 190656

DESCRIPCIÓN

El proyecto corresponde a una edificación destinada a uso Institucional y cubierta con losa con una altura de 4,90m.

La Estructura propuesta corresponde, a una configuración de portico de concreto resistente a momento con grado de disipación de energía (DES). Los entrepisos o losas de cubierta se encuentran conformadas por losas macizas.

Las cargas consideradas para el diseño son las estipuladas en el capítulo B de la norma NSR-10, así: Carga viva sobre losas 250 Kg/m², Carga viva sobre cubierta 50 Kg/m², peso de muros 300 Kg/m², acabados 150 KG/m², salvo aquellos espacios abiertos en los cuales se hizo la ponderación de la carga de muros para cada circunstancia.

Las especificaciones de los materiales son: concretos de $f'c= 21\text{MPa}$ para vigas y $f'c= 21\text{MPa}$ para columnas, y acero de refuerzo $f_y= 420\text{MPa}$

La cimentación estará conformada por losa flotante con vigas de cimentación. La capacidad admisible del suelo es de 3,00 ton/m².

El método de cálculo corresponde al de la resistencia última, y el análisis sísmico se desarrolló por el método modal.

Para la modelación del módulo se utilizaron elementos tipo Frame en la ubicación de vigas y columnas con el fin de evaluar su comportamiento, elemento tipo Shell para la modelación de cubierta que en este caso al tratarse de una losa de cubierta se supuso como diafragma rígido en su plano, todos los elementos de soporte se encuentran empotrados en el nivel 0.00m. El análisis de comportamiento se realizó con la herramienta ETABS 9,7,3.

El predio está ubicado en un sector especial de acuerdo al estudio de sitio realizado y a la entrega de las características y condiciones de la zona especificados en el estudio de suelos de acuerdo con la Norma de Construcción Sismoresistente de 2010, Amenaza de riesgo Sísmico Alto. $A_a = 0.25$, $F_a = 1.3$, $I = 1,25$,

Para el calculo de la fuerza de viento se utiliza el método simplificado de acuerdo con las siguientes consideraciones

B.6.2

Clasificacion Edificio bajo

Altura media de a cubierta (h)= 4,9 < 18 mts Ok!
 Menor dimension horizontal= 5,87 > 2.85 mts Ok!

Clasificacion Edificio Cerrado

Velocidad Basica de viento V= 100 km/h Dec 340 de 2012
 B.6.4.1 (Región 2)

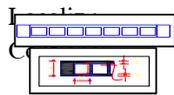

Coefficiente de Importancia I= 1,00
 A.2.5. Educativo

Rugosidad del terreno= B H > 9.0 mts
 Categoría de exposición= B

Factor de ajuste altura λ = 1,0
 B.6.4.2
 B.6.5.7 H < 4.5-> Kzt= 1,0

$P_s = \lambda \cdot K_{zt} \cdot P_{s10} = -0,23 \text{ KN/m}^2 \Rightarrow -23 \text{ Kg/m}^2$
 Se utiliza la minima $q = 0,4 \text{ KN/m}^2 \Rightarrow 40 \text{ Kg/m}^2$
 de acuerdo con B.6.1.3

Verificación Factor de Ajuste

De acuerdo con el metodo de la fuerza horizontal X 90% (Diseño)

Peso estructura = 106,38 Ton
Vs = 97,24 Ton

$V_s = M g \times S_a = 106,38 \times 1,015625 \times 0,9 = 97,24$

Factor de ajuste

Cortante Dinamico
Vsx = 76,77 Ton Vs/Vsx -> 1,267
Vsy = 96,42 Ton Vs/Vsy -> 1,008

Capitulo A.5.4.5

$0,80 \frac{V_s}{V_{ij}}$ para estructuras regulares

(A.5.4-4)
